APPENDIX

FELINE NF RENAL FUNCTION™ EARLY CARE

Complete dietetic pet food for adult cats for the support of renal function in case of early stages of feline chronic renal insufficiency (CRI).

RECOMMENDED FOR & NOT RECOMMENDED FOR

- Early stages (IRIS stages 1 & 2) of chronic renal insufficiency
- √ Temporary renal insufficiency*
 - Reduction of formation of urate stones
- Support of heart function in the case of chronic cardiac insufficiency
- Not suitable for pregnancy, lactation and growth

* The recommended period for use is two to four weeks.

85 g

1.5 kg

KEY 3ENEFITS

Moderate amount of high quality protein

to support renal function from the early stages of CRI and help maintain an adequate muscle mass

Restricted level of phosphorus

to help slow the progression of CRI from the early stages

With restricted phosphorus levels and added omega-3 fatty acids, potassium and antioxidants

to help support renal function

Specifically formulated to meet the needs of cats with early stages of CRI

High palatability for good acceptance

Dietary phosphorus restriction

to help slow the progression of CRI and minimise the risk of secondary renal hyperparathyroidism $\,$

Added potassium

to help reduce the risk of hypokalemia in CRI

Minimises formation of toxic uraemic compounds

by providing a moderate amount of amino acids

May help to reduce glomerular hypertension and inflammation thanks to omega-3 fatty acids

Added B-complex vitamins

to compensate losses through polyuria linked with CRI

Contains sources of fibre to promote good faecal consistency in cats with CRI

Helps reduce the recurrence of uroliths (calcium oxalate) requiring urine alkalisation*

ADDITIONAL BENEFITS & CHARACTERISTICS

^{*} In most instances, however, PPVD UR Urinary™ would be the product of choice for CaOx management.

APPENDIX

FELINE NF RENAL FUNCTION™ EARLY CARE

COMPOSITION (DRY)

Wheat flour#, corn#, rice#, wheat gluten#, soya meal#, corn protein meal#, pork fat, dried beet pulp, dried egg#, minerals, pea hulls, hydrolysed soya protein#, fish oil, digest#, yeast, xylose.

Protein sources.

COMPOSITION (POUCH)

Pork (kidney, liver, meat, dehydrated protein), chicken 8%, dried egg fish oil, sunflower oil, dried yeast, salmon, rice, cellulose, minerals, various sugars.

KEY NUTRIENT VALUES*				
	Dry	Pouch		
Moisture	6.5%	80%		
Protein	29.0%	8.5%		
Fat - Omega-6 fatty acids - Omega-3 fatty acids - EPA + DHA	12.0% 1.8% 0.3% 0.23%	6.6% 1.45% 0.22% 0.11%		
Carbohydrates	44.5%	2.7%		
Crude fibre	3.0%	0.5%		
Calcium	0.6%	0.17%		
Phosphorus	0.35%	0.11%		
Potassium	0.8%	0.34%		
Sodium	0.2%	0.07%		
Vitamin A	25668 IU/kg	29450 IU/kg		
Vitamin D ₃	1261 IU/kg	422 IU/kg		
Vitamin E	585 IU/kg	272 IU/kg		
Taurine	1400 mg/kg	1230 mg/kg		
Metabolisable energy (ME) ¹	379 kcal/100g	99 kcal/100g		

^{*} Typical analysis in the final product as fed.

FEEDING GUIDELINES

The recommended period of use is initially up to 6 months, although the product can be used long term. A gradual transition to the new diet may be especially helpful in cats with CRI. Cats with CRI that remain inappetent should be assessed for nausea. Warming the product to room temperature can enhance palatability for cats with a fussy appetite.

	Daily feeding quantity			
Body weight (kg)	Ory only	Pouch only	Dry + pouch combined	
Dr	y (g/day)	Pouch/day	Dry (g/day)	Pouch/day
2	30	11/3	20	1/3
3	45	2	30	1/2
4	60	23/4	35	1
5	75	31/3	50	1
>5 4	- 15 g/kg	+ ²/₃ pouch/kg	+ 15 g/kg	1

¹ Calculated following NRC 2006 equations.

1.5 kg and 5 kg

APPENDIX

FELINE NF RENAL FUNCTION™ ADVANCED CARE

Complete dietetic dry pet food for adult cats for the support of renal function in case of advanced stages of feline chronic renal insufficiency (CRI).

RECOMMENDED FOR & NOT RECOMMENDED FOR

- Help support later stages (IRIS stages 3 & 4) of chronic renal insufficiency
- √ Temporary renal insufficiency*
- ✓ The reduction of urate stones formation
- ▼ The support of heart function in the case of chronic cardiac insufficiency
- Not suitable for pregnancy, lactation and growth

85 g

* The recommended period for use is two to four weeks.

NE T SENEFITS

ADDITIONAL BENEFITS & CHARACTERISTICS

Restricted but high quality protein

to help minimise loss of muscle mass and toxin formation and restricted phosphorus to help slow the progression of CRI

195 g

Increased levels of omega-3 fatty acids: with EPA and DHA to help support kidney function in the advanced stages of CRI

Great taste to satisfy cats with reduced appetite

Specifically formulated to meet the needs of cats with advanced stages of CRI

Dietary phosphorus restriction

to help slow the progression of CRI and minimise the risk of secondary renal hyperparathyroidism $\,$

Source of omega-3 fatty acids

which may help reduce glomerular hypertension and minimise glomerular inflammation

Added potassium

to help reduce the risk of hypokalemia in CRI

Added B-complex vitamins

to replace losses through polyuria linked with the CRI

Helps reduce the risk of metabolic acidosis in CRI

Contains sources of fibre to promote good faecal consistency in cats with CRI

Highly digestible formula to help cats with compromised GI function

FELINE NF RENAL FUNCTION™ ADVANCED CARE

COMPOSITION (DRY)

Wheat flour#, rice#, wheat gluten#, soya meal#, pork fat, corn protein meal#, corn#, dried beet pulp, dried egg#, fish oil, minerals, digest#, yeast, xylose.

Protein sources.

COMPOSITION (CAN)

Pork liver, turkey, poultry heart and liver, salmon, pork fat, rice flour, minerals, sunflower oil. fish oil, various sugars.

COMPOSITION (POUCHES)

Salmon variety:

Pork (kidney, liver, meat, dehydrated protein, fat), chicken, salmon (6%), rice, wheat gluten, dried yeast, sunflower oil, fish oil, cellulose, minerals, various sugars.

Chicken variety:

Pork (kidney, liver, meat, dehydrated protein, fat), chicken (8%), salmon, rice, wheat gluten, dried yeast, sunflower oil. fish oil. cellulose. minerals, various sugars.

KEY NUTRIENT VALUES*					
	Dry	Can	Pouches**		
Moisture	6.5%	79%	77.2%		
Protein	28.0%	7.0%	7.2%		
Fat - Omega-6 fatty acids - Omega-3 fatty acids - EPA + DHA	16.0% 2.0% 0.8% 0.6%	9.1% 2.03% 0.24% 0.14%	9.4% 1.32% 0.2% 0.14%		
Carbohydrates	43.0%	2.9%	4.1%

Phosphorus	0.33%	0.09%	0.11%		
Potassium	0.8%	0.44%	0.34%		
Sodium	0.2%	0.06%	0.07%		
Vitamin A	25509 IU/kg	75530 IU/kg	35296 IU/kg		
Vitamin D ₃	1523 IU/kg	282 IU/kg	368 IU/kg		
Vitamin E	586 IU/kg	306 IU/kg	282 IU/kg		
Taurine	1400 mg/kg	1470 mg/kg	1365 mg/kg		
Metabolisable energy (ME) ¹	407 kcal /100g	115 kcal /100g	122 kcal /100g		

^{*} Typical analysis in the final product as fed.

FEEDING GUIDELINES

The recommended period of use is initially up to 6 months, although the product can be used long term. A gradual transition to the new diet may be especially helpful in cats with CRI. Cats with CRI that remain inappetent should be assessed for nausea. Warming the product to room temperature can enhance palatability for cats with a fussy appetite.

ADULT MAINTENANCE

Body	Daily feeding quantity						
weight (kg)	Dry only	Can only	Pouch only	Dry + can combined		Dry + pouch combined	
	Dry (g/day)	Cans/day	Pouch/day	Dry (g/day)	Cans/day	Dry (g/day)	Pouch/day
2	30	1/2	1	10	1/3	10	1/3
3	40	3/4	12/3	10	1/2	20	1/2
4	55	1	21/4	10	3/4	30	1
5	70	11/4	23/4	15	1	45	1
>5	+ 15 g/kg	+ 1/4 can/kg	+1/2 pouch/kg	+ 10 g/kg	1	+ 15 g/kg	1

For cats over 5kg: for each additional 1 kg of body weight, feed an additional ¼ can or ½ pouch per day when only wet food, and 15 g of dry food when only dry food fed.

When feeding dry and wet can, for each addition of 1/3 Feline NF can reduce by 20g dry kibble.

^{**} Average of the two varieties.

¹ Calculated following NRC 2006 equations.

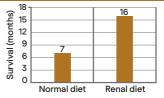

NUTRITIONAL MANAGEMENT OF CHRONIC RENAL INSUFFICIENCY (CRI) IN CATS

1 in 3 cats over the age of 10 years will be diagnosed with CRI^{1,2}.

CRI is considered an irreversible condition, but with appropriate dietary intervention we can help to:

- Ameliorate or prevent clinical consequences of CRI and uraemia;
- Slow progression of CRI and/or prolong survival;
- Minimise derangements of electrolyte, mineral, and acid-base balance;
- Maintain adequate nutrition³.

DIETARY MANAGEMENT OF CRI SIGNIFICANTLY IMPROVES SURVIVAL IN CATS

Survival (months) of cats with CRI fed a conventional ('normal') diet or commercial renal diet⁴

THE ROLE OF NUTRITION IN CRI

For most cats with CRI, dietary intervention represents the single most important therapeutic intervention⁴⁻⁶. As well as improving the quality of life for the cat, clinical studies have consistently shown that well-designed dietary intervention for cats with CRI has the power to help prolong survival and reduce adverse uraemic events⁷.

Numerous studies have shown that veterinary diets specially formulated for renal conditions favour better clinical outcomes, improve quality of life, and can extend life span in cats, when compared to feeding maintenance diets^{4,5,8,9}.

The IRIS (International Renal Interest Society) board was created to help practitioners better understand, diagnose and treat renal disease in cats and dogs. They have created an internationally recognised set of guidelines for classifying and managing chronic kidney disease (CKD).

The staging system facilitates appropriate treatment and management recommendations, and advises on monitoring and further diagnostics³.

Accurate staging of CRI is key in order to provide the right management to your feline patients at every stage.

NUTRITIONAL MANAGEMENT OF CHRONIC RENAL INSUFFICIENCY (CRI) IN CATS

IRIS STAGING AND NUTRITION

During the earlier stages of CRI (IRIS 1 & 2), there is progressive damage to the kidney tissue. There is often an absence of clinical signs at this stage, meaning that unless there are regular veterinary health checks and screening of individuals then this progression of CRI can go missed. 11% of cats with CRI are detected on routine screening, demonstrating the benefit of this. Azotaemia and clinical signs of CRI generally start to become detectable towards the end of IRIS stage 2. An increasing number and severity

of clinical signs are seen in the more advanced stages (IRIS 3 & 4), once less than 33% of functional kidney tissue remains. Cats at different stages of CRI can have very different nutritional requirements.

Renal diet ranges now offer different formulations depending on the IRIS stage of CKD. The challenge is to balance the unique nutrient needs of cats, as obligate carnivores, and the dietary modifications that will help ameliorate clinical signs and slow the progression of CRI.

NUTRITIONAL MODIFICATIONS AND BENEFITS OF DIETS SPECIALLY FORMULATED FOR RENAL CONDITIONS IN CATS12,345,6

Maximising dietary support to kidney function in the early stages of CKD is important to help maintain an appropriate electrolyte balance, control calcium-phosphorus levels, minimising the risk of secondary renal hyperparathyroidism, and help reduce the formation of nitrogenous waste products.

In advanced stages, dietary phosphorus and protein levels should be further restricted because the levels of excretion through urine decrease as the condition progresses.

to help slow the progression of CKD

to help reduce nitrogenous waste

ega-3 fatty acids to help reduce glomerular hypertension and

and low sodium to maintain electrolyte balance and minimise elevations in blood pressure

CHRONIC **KIDNEY** DISEASE

Great taste to facilitate diet acceptance before the cat's appetite starts . to become negatively . affected

to help slow the progression of CKD

> **Further restricted** to help reduce nitrogenous waste

Higher levels of omega-3 fatty acids to help reduce glomerular hypertension and inflammation

to help maintain body condition and weight, a key prognostic facto

NUTRITIONAL MANAGEMENT OF CHRONIC RENAL INSUFFICIENCY (CRI) IN CATS

CLINICAL ADVANTAGES WITH THE USE OF FELINE NF RENAL FUNCTION™

PRO PLAN® VETERINARY DIETS NF RENAL FUNCTION™ EARLY CARE

- Early phosphorus restriction to help slow the progression of CRI
- Moderate levels of high quality proteins to help reduce nitrogenous
- Added omega-3 fatty acids
- Added potassium and reduced

It is important to ensure that patients will accept the diet and will eat it consistently from the early stages of CRI, before their appetite starts to become affected as a consequence of uraemic toxins.

PRO PLAN® VETERINARY DIETS NF RENAL FUNCTION™ ADVANCED CARE

- Further phosphorus restriction to help slow the progression of CRI
 - Further restricted high quality proteins to help reduce nitrogenous waste, which can lead to nausea and inappetence
 - Higher levels of omega-3 fatty acids
- Added potassium and reduced sodium
 - Higher energy density than Early Care to help maintain body weight, a key prognostic factor

The biological value of protein, including a complete amino acid profile and high protein digestibility, is key to maintain lean muscle mass and maintain healthy weight at any stage of CRI.
